

Application No. 10/055,796 (Tarnoff) Art Unit 2157 Amendment A page 4 of 21

**Claims:** *Please amend the claims according to the status designations in the following list, which contains all claims that were ever in the application, with the text of all active claims.*

1. (CURRENTLY AMENDED) A system adapted for installation on ~~the~~ a platform of ~~the~~ an existing website for both limiting and expanding content sent to a client over ~~said~~ a network connected to said website comprising: a node registration database configured to store ~~the~~ locations of plural nodes of said network, a rules database configured to store rules regarding content to be sent to clients by said website, and a content validator configured to automatically review said content before said content is transmitted to the client, and controlling access by a client to said content in accordance with the decision of said content validity.
2. (CURRENTLY AMENDED) The system of claim 1, wherein ~~this~~ said rules stored in said rules database include one or more of the following: 1. Only allow access from particular nodes 2. Only provide access during certain hours of the day 3. Only allow access from registered users using a security key 4. Only allow access from within a particular geographic region 5. Only allow access with the receipt of payment or credit approval 6. Transmit notifications, if any, to a particular node at only certain intervals.
3. (CURRENTLY AMENDED) A system for automatically updating a plurality of search engines in a network with content changes in a site included in said network comprising: a RevBot installed at said site, said RevBot comprising: parser means responsive to incoming requests for content updates ~~from said search engines in said network~~; node registration means coupled to said parser means for storing a list of node network locations of said search engines; and means responsive to said parser means and said node registration means for automatically transmitting said content changes to said search engines.
4. (CURRENTLY AMENDED) A RevBot for automatically controlling access to a website, said RevBot adapted for installation on ~~the~~ a platform of an existing website, said RevBot comprising: a parser coupled to the network in which said website is installed; a rules file; a rules applier coupled to said rules file; a content validator; and an access control and deny module responsively coupled to said rules applier, and operatively and responsively coupled to said website and to said content validator.

Application No. 10/055,796 (Tarnoff) Art Unit 2157 Amendment A page 5 of 21

5. (ORIGINAL) A RevBot for automatically updating information and content at network nodes hosting search engine databases, said RevBot comprising: a parser coupled to the network in which website is installed; a notification module responsively coupled to said parser; and a node registration module coupled to said notification module so that nodes registered in said node registration module will be automatically sent content update notifications.
6. (ORIGINAL) In a system adapted for installation on the platform of an existing network site, the method of automatically assisting search engines connected to said network, comprising the computer-implemented steps of: storing the location of plural search engine nodes of said network; storing rules regarding content to be sent to said search engine nodes; and automatically transmitting content changes to said search engines over said network to update said search engines.
7. (NEW) A system adapted for installation on a platform of an existing website for detecting a platform-related event, notification of which is sent to a client over a network connected to said website comprising: a node registration database configured to store the locations of plural nodes of said network, a rules database configured to store rules regarding the content of notifications to be sent to clients by said website.
8. (NEW) The system of claim 7, wherein said event is a content change.
9. (NEW) A system for automatically notifying a plurality databases on a network about events on a site included in said network comprising: a RevBot installed at said site, said RevBot comprising: logic to detect the occurrences of said events; node registration means coupled to said parser means for storing a list of node network locations of said databases; and means responsive to said detection means and said node registration means for automatically transmitting notification about said events to said databases.
10. (NEW) The system of claim 9, wherein said events include content changes.
11. (NEW) The system of claim 10, wherein said databases include search engines.
